

AIRTEK JL SERIES SEVERE DUTY FILTERS

JL Series Severe Duty Two-Stage Filters

Parker Airtek's JL Series is a severe duty, two-stage combination centrifugal separator and high performance filter. The two-stage design was specifically developed for severe industrial service, central systems and critical applications. This design provides optimum performance, and energy savings through low pressure drop; and an element that lasts twice as long.

All JL Series' severe duty, two-stage filters are free standing and top loading. For ease of service the element can be replaced without removing airline or drain piping. The element simply lifts out of the top.

Compressed air purification equipment must deliver uncompromising performance and reliability while providing the right balance of air quality with the lowest cost of operation. Many manufacturers offer products for the filtration and purification of contaminated compressed air, which are often selected only upon their initial purchase cost, with little or no regard for the air quality they provide, the cost of operation throughout their life or indeed their environmental impact. When purchasing purification equipment, delivered air quality, the overall cost of ownership and the equipment's environmental impact must always be considered.

Features & Benefits

- Average pressure drop of only 3.5 psi d over an extended element life 3-4 times longer than conventional coalescers.
- Element condition indicator - standard.
- Element life extended by two-stage design.
- 99% of contaminant load is pre-separated through centrifugal action and "quiet zone" gravity.
- Remaining oil mist is directed into high efficiency coalescing element.
- No particulate pre-filter required

Replacement Elements
