

EVO II Plunger Lift Controller

Communicate with the EVO I with your pre-existing SCADA packages! Now you can install true, dedicated plunger lift algorithms and have it all at the office with the touch of a button. Through Modbus language support you can operate the EVO II just as if you were standing in front of it, have access to live readings and full control of your plunger lift wells.

Did You Know?

The EVO series of controllers are the safest controllers on the market. Pentagon has overcome many new CSA certification standards for Class I Div I zones. The EVO line of controllers cannot be shorted-out across the battery leads due to internal circuitry in the battery. The six-watt panel allows for ample power in any northern light conditions and the battery voltage is cycled once a week at 7.5 volts to allow for cell leveling. This will give us the leading edge in rechargeable gel cell life cycles making the EVO number one in North America for safety and longevity!
